Abstract—This concept paper proposes a Retrieval-Augmented Generation (RAG) chatbot focused on supporting access to publicly available National Privacy Commission (NPC) complaint procedure information. The study will first review the operations, clientele, services, and public guidance of the NPC to investigate whether data subjects seeking complaint-procedure information experience difficulty finding or understanding the official information they need. If this information-access need is supported by the review and is suitable for RAG, the study will focus on providing guidance about the NPC complaint procedure using authoritative NPC documents. The project will not determine whether a privacy violation occurred, investigate actual cases, or decide the outcome of a complaint. The chatbot will retrieve relevant NPC information before generating a response. The proposed study will compare RAG-based answers with answers from a chatbot without RAG using controlled test questions. Responses will be checked for correctness, groundedness, completeness, and proper handling of unsupported questions. The project focuses on information access and guidance rather than replacing official NPC procedures or making official decisions.

Keywords—data privacy, National Privacy Commission, RAG, information access, privacy inquiries, SDG 16

I. SELECTED UN SDG AND JUSTIFICATION

A. Selected SDG and Relevance

The proposed study is connected to Sustainable Development Goal 16: Peace, Justice and Strong Institutions. It is particularly relevant to the SDG's focus on effective, accountable, and inclusive institutions and access to information related to public services. For this study, the connection is based on helping users access and understand official information provided by a government institution responsible for data privacy.

B. Justification

The National Privacy Commission serves data subjects and other users who may need information about data privacy rights, complaints, and related procedures. Following the project feedback, the group will first review the NPC's operations, clientele, services, public guidance, and available information to identify an information-access need that is important, recurring, and suitable for a RAG-based solution. The complaint procedure is the proposed research direction, but the study will verify whether difficulty finding or understanding complaint-procedure information is actually experienced by the intended users before treating it as an established problem.

C. Connection to RAG

A RAG chatbot can potentially help users access relevant NPC information by retrieving passages from publicly available and authoritative NPC documents. If information needed by users is available online, these documents can be collected, prepared, and chunked into a knowledge base. The chatbot can then use the retrieved passages to answer questions and explain relevant procedures or guidance while indicating when the available information is insufficient.

II. NARROW PROBLEM STATEMENT

The study will investigate whether data subjects seeking information about the NPC complaint procedure regarding a privacy concern experience difficulty finding or understanding the official information relevant to their inquiry. The review will examine NPC clientele, services, and publicly available guidance to determine whether this represents a recurring information-access need that can be addressed through RAG. The study will not assume that this difficulty exists without supporting evidence from the review.

If the review supports this information-access need, the study will focus on one complaint-procedure information need rather than attempting to address all data privacy concerns or all NPC services. The target users will be data subjects seeking information about the NPC complaint procedure regarding a privacy concern, subject to confirmation through the review of NPC clientele and services. The scope will cover official information such as who may file a complaint, what information or documents may be needed, the steps for filing, and where a complaint may be submitted.

The proposed chatbot will only provide information and guidance based on the selected NPC documents. It will not make official NPC decisions, determine whether a privacy violation occurred, investigate actual cases, decide complaint outcomes, or access confidential client records.

III. PRIMARY RESEARCH QUESTION

The primary research question is: To what extent can a RAG-based chatbot provide correct, complete, and well-supported answers to NPC complaint-procedure inquiries using publicly available National Privacy Commission information compared with a chatbot without RAG?

This question focuses on access to official complaint-procedure information and can be evaluated using a defined collection of NPC documents and a controlled set of

questions. The evaluation questions will focus on who may file, required information or documents, filing steps, submission methods, and where to obtain official guidance. Responses from the RAG-based and non-RAG systems will be compared using correctness, groundedness, completeness, and appropriate handling of questions that are not supported by the knowledge base.

IV. Initial Knowledge-Based Data Sources

A. National Privacy Commission Data Subject Rights

The NPC's Data Subject Rights materials provide official information about rights available to data subjects, including the right to be informed, access, objection, rectification, erasure or blocking, data portability, and complaint-related processes. These materials may provide supporting context for questions about a data subject's right to seek assistance or file a complaint.

B. National Privacy Commission: Complaint Procedure

The NPC provides public information about filing a complaint. These official materials will be the main source for the knowledge base because they directly describe the complaint procedure, requirements, and submission process. The group will prioritize the most current official NPC guidance relevant to the selected information need.

C. Other NPC Public Guidance Related to Complaints

Other publicly available NPC webpages, publications, issuances, and guidance may be included when they directly support the complaint-procedure information need. The final documents will be selected based on relevance, currency, public accessibility, authority, and suitability for use in a RAG knowledge base. The group will prioritize official NPC sources and will avoid adding documents that are not directly relevant to the selected complaint-procedure questions.

V. Initial Evaluation Data Plan

The group plans to prepare about 20–30 controlled test questions about the NPC complaint procedure. The questions will represent realistic information needs such as who may file, what information or documents are needed, what steps should be followed, how a complaint may be submitted, and where official guidance can be found.

The expected answers and supporting passages will be established from the selected NPC documents. A small number of questions will also be intentionally outside the knowledge base to test whether the chatbot can acknowledge that there is insufficient information instead of generating an unsupported answer. The evaluation will not require access to confidential NPC records or private client information.

The evaluation will compare RAG and non-RAG responses using correctness, groundedness, completeness, and appropriate handling of unsupported questions.

VI. Possible Language Model and Justification

A. Proposed Model

The proposed language model is GPT-OSS 20B (openai/gpt-oss-20b) through Groq. It is a preliminary model choice because the RAG experiment will require the model to process a user's question together with retrieved passages from the NPC knowledge base.

B. Expected Role

The model will receive the user's complaint-procedure question and the relevant passages retrieved from the NPC knowledge base. It will use the retrieved information to generate a clear, understandable, and document-grounded response. It should also indicate when the retrieved documents do not contain enough information to answer the question confidently.

C. Practical Considerations

The first version of the study may focus on English questions and English NPC documents. Filipino or Taglish questions can be added later if the group decides to test them separately. GPT-OSS 20B is only a preliminary model choice and should not be described as the best model without comparative evidence. The experiment will also depend on access to the model through the selected service and on the size and quality of the retrieved NPC documents.

VII. Group Reflection

The proposed problem remains narrow and manageable because the study will not attempt to solve all data privacy problems or reproduce the full operations of the NPC. Following the proposal's feedback, the group will first examine the NPC's operations, clientele, services, and public information to determine whether complaint-procedure information access is a recurring user need. If supported, the knowledge base can be limited to relevant official NPC documents, and the evaluation can use a manageable set of controlled questions. This creates a clear connection between the user information need, the documents, the RAG system, and the research question.
